

access with an edge

NetAXS-123 takes web-based access control to the edge—saving precious time and money on installations.

If you're looking to give your business a competitive edge, Honeywell's NetAXS-123 can help. NetAXS-123 with Ethernet Virtual Loop (EVL) pushes access control to the next level by eliminating the need for long runs of multiple cables and replacing them with just one PoE cable for each door. From there, you only need a few feet of cable to reach locks, readers, power supplies and contacts. Plus, the modular design ensures that it's as easy as 1-2-3 to add more doors at anytime. So get an edge on your competition with an access control system that saves you—and your customers—time and money.
